(b) $\vartheta \mathrm{BI}=\mathrm{LT}^{-1} \times \mathrm{MI}^{-1} \mathrm{~T}^{-2} \times \mathrm{L}=\mathrm{ML}^{2} \mathrm{I}^{-1} \mathrm{~T}^{-3}$
(c) $\mathrm{d} \phi_{\mathrm{s}} / \mathrm{dt}=\mathrm{MI}^{-1} \mathrm{~T}^{-2} \times \mathrm{L}^{2}=\mathrm{ML}^{2} \mathrm{I}^{-1} \mathrm{~T}^{-2}$
2. $\phi=a t^{2}+b t+c$
(a) $a=\left[\frac{\phi}{t^{2}}\right]=\left[\frac{\phi / t}{t}\right]=\frac{\text { Volt }}{\text { Sec }}$

$$
\mathrm{b}=\left[\frac{\phi}{\mathrm{t}}\right]=\text { Volt }

$$
c=[\phi]=\text { Weber }
$$

(b) $\mathrm{E}=\frac{\mathrm{d} \phi}{\mathrm{dt}} \quad[\mathrm{a}=0.2, \mathrm{~b}=0.4, \mathrm{c}=0.6, \mathrm{t}=2 \mathrm{~s}]$

$$

$$

$$

$$

3. (a) $\phi_{2}=$ B.A. $=0.01 \times 2 \times 10^{-3}=2 \times 10^{-5}$.

$$
\begin{aligned}
& \phi_{1}=0 \\

$$

(b) emf is not constant in case of $\rightarrow 10-20 \mathrm{~ms}$ and $20-30 \mathrm{~ms}$ as -4 mV and 4 mV .
4. $\phi_{1}=B A=0.5 \times \pi\left(5 \times 10^{-2}\right)^{2}=5 \pi 25 \times 10^{-5}=125 \times 10^{-5}$
$\phi_{2}=0$
$E=\frac{\phi_{1}-\phi_{2}}{t}=\frac{125 \pi \times 10^{-5}}{5 \times 10^{-1}}=25 \pi \times 10^{-4}=7.8 \times 10^{-3}$.
5. $A=1 \mathrm{~mm}^{2} ; i=10 \mathrm{~A}, \mathrm{~d}=20 \mathrm{~cm} ; \mathrm{dt}=0.1 \mathrm{~s}$
$\mathrm{e}=\frac{\mathrm{d} \phi}{\mathrm{dt}}=\frac{\mathrm{BA}}{\mathrm{dt}}=\frac{\mu_{0} \mathrm{i}}{2 \pi \mathrm{~d}} \times \frac{\mathrm{A}}{\mathrm{dt}}$

$$
=\frac{4 \pi \times 10^{-7} \times 10}{2 \pi \times 2 \times 10^{-1}} \times \frac{10^{-6}}{1 \times 10^{-1}}=1 \times 10^{-10} \mathrm{~V}
$$

6. (a) During removal,
$\phi_{1}=$ B.A. $=1 \times 50 \times 0.5 \times 0.5-25 \times 0.5=12.5$ Tesla m $^{2}$
$\phi_{2}=0, \tau=0.25$
$\mathrm{e}=-\frac{\mathrm{d} \phi}{\mathrm{dt}}=\frac{\phi_{2}-\phi_{1}}{\mathrm{dt}}=\frac{12.5}{0.25}=\frac{125 \times 10^{-1}}{25 \times 10^{-2}}=50 \mathrm{~V}$
(b) During its restoration

$$
\begin{aligned}
& \phi_{1}=0 ; \phi_{2}=12.5 \text { Tesla }-\mathrm{m}^{2} ; \mathrm{t}=0.25 \mathrm{~s} \\

$$

(c) During the motion

$$
\begin{aligned}
& \phi_{1}=0, \phi_{2}=0 \\
& E=\frac{d \phi}{d t}=0
\end{aligned}
$$

7. $\mathrm{R}=25 \Omega$
(a) $\mathrm{e}=50 \mathrm{~V}, \mathrm{~T}=0.25 \mathrm{~s}$
$i=e / R=2 A, H=i^{2} R T$
$=4 \times 25 \times 0.25=25 \mathrm{~J}$
(b) $e=50 \mathrm{~V}, \mathrm{~T}=0.25 \mathrm{~s}$
$i=e / R=2 A, H=i^{2} R T=25 \mathrm{~J}$
(c) Since energy is a scalar quantity

Net thermal energy developed $=25 \mathrm{~J}+25 \mathrm{~J}=50 \mathrm{~J}$.
8. $A=5 \mathrm{~cm}^{2}=5 \times 10^{-4} \mathrm{~m}^{2}$
$B=B_{0} \sin \omega t=0.2 \sin (300 t)$
$\theta=60^{\circ}$
a) Max emf induced in the coil
$E=-\frac{d \phi}{d t}=\frac{d}{d t}(B A \cos \theta)$
$=\frac{\mathrm{d}}{\mathrm{dt}}\left(\mathrm{B}_{0} \sin \omega \mathrm{t} \times 5 \times 10^{-4} \times \frac{1}{2}\right)$
$=\mathrm{B}_{0} \times \frac{5}{2} \times 10^{-4} \frac{\mathrm{~d}}{\mathrm{dt}}(\sin \omega \mathrm{t})=\frac{\mathrm{B}_{0} 5}{2} \times 10^{-4} \cos \omega \mathrm{t} \cdot \omega$
$=\frac{0.2 \times 5}{2} \times 300 \times 10^{-4} \times \cos \omega \mathrm{t}=15 \times 10^{-3} \cos \omega \mathrm{t}$

$$
E_{\max }=15 \times 10^{-3}=0.015 \mathrm{~V}
$$

b) Induced emf at $t=(\pi / 900) \mathrm{s}$
$E=15 \times 10^{-3} \times \cos \omega t$
$=15 \times 10^{-3} \times \cos (300 \times \pi / 900)=15 \times 10^{-3} \times 1 / 2$
$=0.015 / 2=0.0075=7.5 \times 10^{-3} \mathrm{~V}$
c) Induced emf at $t=\pi / 600 \mathrm{~s}$

$$
\begin{aligned}
& E=15 \times 10^{-3} \times \cos (300 \times \pi / 600) \\
& =15 \times 10^{-3} \times 0=0 \mathrm{~V}
\end{aligned}
$$

9. $\vec{B}=0.10 \mathrm{~T}$
$\mathrm{A}=1 \mathrm{~cm}^{2}=10^{-4} \mathrm{~m}^{2}$
$\mathrm{T}=1 \mathrm{~s}$
$\phi=$ B.A. $=10^{-1} \times 10^{-4}=10^{-5}$
$\mathrm{e}=\frac{\mathrm{d} \phi}{\mathrm{dt}}=\frac{10^{-5}}{1}=10^{-5}=10 \mu \mathrm{~V}$

10. $\mathrm{E}=20 \mathrm{mV}=20 \times 10^{-3} \mathrm{~V}$
$A=\left(2 \times 10^{-2}\right)^{2}=4 \times 10^{-4}$
$D t=0.2 \mathrm{~s}, \theta=180^{\circ}$
$\phi_{1}=B A, \phi_{2}=-B A$
$\mathrm{d} \phi=2 \mathrm{BA}$
$E=\frac{\mathrm{d} \phi}{\mathrm{dt}}=\frac{2 \mathrm{BA}}{\mathrm{dt}}$
$\Rightarrow 20 \times 10^{-3}=\frac{2 \times \mathrm{B} \times 2 \times 10^{-4}}{2 \times 10^{-1}}$
$\Rightarrow 20 \times 10^{-3}=4 \times \mathrm{B} \times 10^{-3}$
$\Rightarrow B=\frac{20 \times 10^{-3}}{42 \times 10^{-3}}=5 \mathrm{~T}$
11. Area $=A$, Resistance $=R, B=$ Magnetic field
$\phi=\mathrm{BA}=\mathrm{Ba} \cos 0^{\circ}=\mathrm{BA}$
$e=\frac{d \phi}{d t}=\frac{B A}{1} ; i=\frac{e}{R}=\frac{B A}{R}$
$\phi=\mathrm{iT}=\mathrm{BA} / \mathrm{R}$
12. $r=2 \mathrm{~cm}=2 \times 10^{-2} \mathrm{~m}$
$\mathrm{n}=100$ turns $/ \mathrm{cm}=10000$ turns $/ \mathrm{m}$
$\mathrm{i}=5 \mathrm{~A}$
$B=\mu_{0} n i$
$=4 \pi \times 10^{-7} \times 10000 \times 5=20 \pi \times 10^{-3}=62.8 \times 10^{-3} \mathrm{~T}$
$\mathrm{n}_{2}=100$ turns
$\mathrm{R}=20 \Omega$
$r=1 \mathrm{~cm}=10^{-2} \mathrm{~m}$
Flux linking per turn of the second coil $=B \pi r^{2}=B \pi \times 10^{-4}$
$\phi_{1}=$ Total flux linking $=\mathrm{Bn}_{2} \pi \mathrm{r}^{2}=100 \times \pi \times 10^{-4} \times 20 \pi \times 10^{-3}$
When current is reversed.
$\phi_{2}=-\phi_{1}$
$\mathrm{d} \phi=\phi_{2}-\phi_{1}=2 \times 100 \times \pi \times 10^{-4} \times 20 \pi \times 10^{-3}$
$E=-\frac{\mathrm{d} \phi}{\mathrm{dt}}=\frac{4 \pi^{2} \times 10^{-4}}{\mathrm{dt}}$
$I=\frac{E}{R}=\frac{4 \pi^{2} \times 10^{-4}}{\mathrm{dt} \times 20}$
$q=I d t=\frac{4 \pi^{2} \times 10^{-4}}{d t \times 20} \times d t=2 \times 10^{-4} C$.
13. Speed $=u$

Magnetic field $=B$
Side $=\mathrm{a}$
a) The perpendicular component i.e. a $\sin \theta$ is to be taken which is $\perp r$ to velocity.
So, $\mathrm{I}=\mathrm{a} \sin \theta 30^{\circ}=\mathrm{a} / 2$.
Net ' $a$ ' charge $=4 \times a / 2=2 a$
So, induced emf $=\mathrm{B} 9 \mathrm{I}=2 \mathrm{auB}$

b) Current $=\frac{E}{R}=\frac{2 a u B}{R}$
14. $\phi_{1}=0.35$ weber, $\phi_{2}=0.85$ weber
$\mathrm{D} \phi=\phi_{2}-\phi_{1}=(0.85-0.35)$ weber $=0.5$ weber
$\mathrm{dt}=0.5 \mathrm{sec}$
$\mathrm{E}=\frac{\mathrm{d} \phi}{\mathrm{dt}^{\prime}}=\frac{0.5}{0.5}=1 \mathrm{v}$.
The induced current is anticlockwise as seen from above.
15. $i=v(B \times I)$

$$
=\mathrm{v} \mathrm{BI} \cos \theta
$$

$\theta$ is angle between normal to plane and $\vec{B}=90^{\circ}$.

$$
=\mathrm{v} \operatorname{BI} \cos 90^{\circ}=0
$$

16. $u=1 \mathrm{~cm} /{ }^{\prime}, B=0.6 \mathrm{~T}$
a) At $=2 \mathrm{sec}$, distance moved $=2 \times 1 \mathrm{~cm} / \mathrm{s}=2 \mathrm{~cm}$

$$
\mathrm{E}=\frac{\mathrm{d} \phi}{\mathrm{dt}}=\frac{0.6 \times(2 \times 5-0) \times 10^{-4}}{2}=3 \times 10^{-4} \mathrm{~V}
$$

b) At $t=10 \mathrm{sec}$
distance moved $=10 \times 1=10 \mathrm{~cm}$
The flux linked does not change with time
$\therefore \mathrm{E}=0$
c) At t $=22 \mathrm{sec}$

distance $=22 \times 1=22 \mathrm{~cm}$
The loop is moving out of the field and 2 cm outside.
$E=\frac{d \phi}{d t}=B \times \frac{d A}{d t}$

$$
=\frac{0.6 \times\left(2 \times 5 \times 10^{-4}\right)}{2}=3 \times 10^{-4} \mathrm{~V}
$$

d) Att $=30 \mathrm{sec}$

The loop is total outside and flux linked $=0$

$$
\therefore \mathrm{E}=0 .
$$

17. As heat produced is a scalar prop.

So, net heat produced $=\mathrm{H}_{\mathrm{a}}+\mathrm{H}_{\mathrm{b}}+\mathrm{H}_{\mathrm{c}}+\mathrm{H}_{\mathrm{d}}$
$R=4.5 \mathrm{~m} \Omega=4.5 \times 10^{-3} \Omega$
a) $e=3 \times 10^{-4} \mathrm{~V}$
$i=\frac{e}{R}=\frac{3 \times 10^{-4}}{4.5 \times 10^{-3}}=6.7 \times 10^{-2} \mathrm{Amp}$.
$H_{a}=\left(6.7 \times 10^{-2}\right)^{2} \times 4.5 \times 10^{-3} \times 5$
$H_{b}=H_{d}=0$ [since emf is induced for 5 sec]
$H_{c}=\left(6.7 \times 10^{-2}\right)^{2} \times 4.5 \times 10^{-3} \times 5$
So Total heat $=\mathrm{H}_{\mathrm{a}}+\mathrm{H}_{\mathrm{c}}$

$$
=2 \times\left(6.7 \times 10^{-2}\right)^{2} \times 4.5 \times 10^{-3} \times 5=2 \times 10^{-4} \mathrm{~J}
$$

18. $r=10 \mathrm{~cm}, \mathrm{R}=4 \Omega$
$\frac{\mathrm{dB}}{\mathrm{dt}}=0.010 \mathrm{~T} /{ }^{\prime}, \frac{\mathrm{d} \phi}{\mathrm{dt}}=\frac{\mathrm{dB}}{\mathrm{dt}} \mathrm{A}$
$\mathrm{E}=\frac{\mathrm{d} \phi}{\mathrm{dt}}=\frac{\mathrm{dB}}{\mathrm{dt}} \times \mathrm{A}=0.01\left(\frac{\pi \times \mathrm{r}^{2}}{2}\right)$
$=\frac{0.01 \times 3.14 \times 0.01}{2}=\frac{3.14}{2} \times 10^{-4}=1.57 \times 10^{-4}$
$i=\frac{E}{R}=\frac{1.57 \times 10^{-4}}{4}=0.39 \times 10^{-4}=3.9 \times 10^{-5} \mathrm{~A}$

19. a) $S_{1}$ closed $S_{2}$ open
net $R=4 \times 4=16 \Omega$

$$
\mathrm{e}=\frac{\mathrm{d} \phi}{\mathrm{dt}}=\mathrm{A} \frac{\mathrm{~dB}}{\mathrm{dt}}=10^{-4} \times 2 \times 10^{-2}=2 \times 10^{-6} \mathrm{~V}
$$

i through ad $=\frac{e}{R}=\frac{2 \times 10^{-6}}{16}=1.25 \times 10^{-7} \mathrm{~A}$ along ad
b) $R=16 \Omega$

$$
\begin{aligned}
& e=A \times \frac{d B}{d t}=2 \times 0^{-5} \mathrm{~V} \\
& i=\frac{2 \times 10^{-6}}{16}=1.25 \times 10^{-7} \mathrm{~A} \text { along } \mathrm{d} \mathrm{a}
\end{aligned}
$$

c) Since both $S_{1}$ and $S_{2}$ are open, no current is passed as circuit is open i.e. $i=0$
d) Since both $S_{1}$ and $S_{2}$ are closed, the circuit forms a balanced wheat stone bridge and no current will flow along ad i.e. $\mathrm{i}=0$.
20. Magnetic field due to the coil (1) at the center of (2) is $B=\frac{\mu_{0} N \mathrm{Nia}^{2}}{2\left(a^{2}+x^{2}\right)^{3 / 2}}$

\end{aligned}
$$

b) $=\frac{\mu_{0} N \pi a^{2} a^{\prime 2}}{2\left(a^{2}+x^{2}\right)^{3 / 2}} \frac{E R V}{L(R / 2+r)^{2}}($ for $x=L / 2, R / L x=R / 2)$
a) For $x=L$

$$
E=\frac{\mu_{0} N \pi a^{2} a^{\prime 2} R v E}{2\left(a^{2}+x^{2}\right)^{3 / 2}(R+r)^{2}}
$$

21. $N=50, \vec{B}=0.200 \mathrm{~T} ; r=2.00 \mathrm{~cm}=0.02 \mathrm{~m}$
$\theta=60^{\circ}, \mathrm{t}=0.100 \mathrm{~s}$
a) $\mathrm{e}=\frac{\mathrm{Nd} \phi}{\mathrm{dt}}=\frac{\mathrm{N} \times \mathrm{B} \cdot \mathrm{A}}{\mathrm{T}}=\frac{\mathrm{NBA} \cos 60^{\circ}}{\mathrm{T}}$

22. $n=100$ turns, $B=4 \times 10^{-4} \mathrm{~T}$
$A=25 \mathrm{~cm}^{2}=25 \times 10^{-4} \mathrm{~m}^{2}$
a) When the coil is perpendicular to the field

b) $q E=q v B$
$\Rightarrow E=1 \times 10^{-1} \times 1 \times 10^{-1}=1 \times 10^{-2} \mathrm{~V} / \mathrm{m}$

$E=B v \ell=0.2 \mathrm{I} 10^{-4} \times 50=10^{-3} \mathrm{~V}$
$\therefore$ The voltmeter will record 1 mv .
31. a) Zero as the components of ab are exactly opposite to that of bc. So they cancel each other. Because velocity should be perpendicular to the length.
b) $e=B v \times \ell$

34. a) The e.m.f. is highest between diameter $\perp r$ to the velocity. Because here length $\perp r$ to velocity is highest.
$E_{\text {max }}=V B 2 R$
b) The length perpendicular to velocity is lowest as the diameter is parallel to the

47. Given Blv = mg

When wire is replaced we have

88. a) For discharging circuit

$$
\begin{aligned}

& \Rightarrow-0.693=-0.1 / \tau \\
& \Rightarrow \tau=0.1 / 0.693=0.144=0.14 .
\end{aligned}
$$

b) $L=4 H, i=L / R$
$\Rightarrow 0.14=4 / R$
$\Rightarrow R=4 / 0.14=28.57=28 \Omega$.
89.

In this case there is no resistor in the circuit.
So, the energy stored due to the inductor before and after removal of battery remains same. i.e.

$$
V_{1}=V_{2}=\frac{1}{2} L i^{2}
$$

So, the current will also remain same.
Thus charge flowing through the conductor is the same.
90. a) The inductor does not work in DC. When the switch is closed the current charges so at first inductor works. But after a long time the current flowing is constant.

Thus effect of inductance vanishes.

$$
i=\frac{E}{R_{\text {net }}}=\frac{E}{\frac{R_{1} R_{2}}{R_{1}+R_{2}}}=\frac{E\left(R_{1}+R_{2}\right)}{R_{1} R_{2}}
$$

b) When the switch is opened the resistors are in series.

$$
\tau=\frac{L}{R_{\text {net }}}=\frac{L}{R_{1}+R_{2}} .
$$

91. $\mathrm{i}=1.0 \mathrm{~A}, \mathrm{r}=2 \mathrm{~cm}, \mathrm{n}=1000 \mathrm{turn} / \mathrm{m}$

Magnetic energy stored $=\frac{B^{2} V}{2 \mu_{0}}$
Where $\mathrm{B} \rightarrow$ Magnetic field, $\mathrm{V} \rightarrow$ Volume of Solenoid.
$=\frac{\mu_{0} n^{2} i^{2}}{2 \mu_{0}} \times \pi r^{2} h$
$=\frac{4 \pi \times 10^{-7} \times 10^{6} \times 1 \times \pi \times 4 \times 10^{-4} \times 1}{2} \quad[\mathrm{~h}=1 \mathrm{~m}]$
$=8 \pi^{2} \times 10^{-5}$
$=78.956 \times 10^{-5}=7.9 \times 10^{-4} \mathrm{~J}$.
92. Energy density $=\frac{B^{2}}{2 \mu_{0}}$

Total energy stored $=\frac{B^{2} V}{2 \mu_{0}}=\frac{\left(\mu_{0} i / 2 r\right)^{2}}{2 \mu_{0}} V=\frac{\mu_{0} i^{2}}{4 r^{2} \times 2} V$

$$
=\frac{4 \pi \times 10^{-7} \times 4^{2} \times 1 \times 10^{-9}}{4 \times\left(10^{-1}\right)^{2} \times 2}=8 \pi \times 10^{-14} \mathrm{~J} .
$$

93. $\mathrm{I}=4.00 \mathrm{~A}, \mathrm{~V}=1 \mathrm{~mm}^{3}$,
$d=10 \mathrm{~cm}=0.1 \mathrm{~m}$

$$
\vec{B}=\frac{\mu_{0} i}{2 \pi r}
$$

Now magnetic energy stored $=\frac{B^{2}}{2 \mu_{0}} V$

$$
\begin{aligned}
& =\frac{\mu_{0}^{2} \mathrm{i}^{2}}{4 \pi \mathrm{r}^{2}} \times \frac{1}{2 \mu_{0}} \times \mathrm{V}=\frac{4 \pi \times 10^{-7} \times 16 \times 1 \times 1 \times 10^{-9}}{4 \times 1 \times 10^{-2} \times 2} \\
& =\frac{8}{\pi} \times 10^{-14} \mathrm{~J} \\

$$
\begin{aligned}
\frac{\mathrm{dl}}{\mathrm{dt}} & =\frac{\ell \mathrm{A}}{\mathrm{~s}} \\
\mathrm{E} & =-\mu \frac{\mathrm{dl}}{\mathrm{dt}} \\
\Rightarrow \mathrm{E} & =2.5 \times 1=2.5 \mathrm{~V}
\end{aligned}
$$

95. We know

$$
\frac{\mathrm{d} \phi}{\mathrm{dt}}=\mathrm{E}=\mathrm{M} \times \frac{\mathrm{di}}{\mathrm{dt}}
$$

From the question,

$$
\begin{aligned}
& \frac{d i}{d t}=\frac{d}{d t}\left(i_{0} \sin \omega t\right)=i_{0} \omega \cos \omega t \\
& \frac{d \phi}{d t}=E=\frac{\mu_{0} a i_{0} \omega \cos \omega t}{2 \pi} \ln [1+a / b]
\end{aligned}
$$

Now, $E=M \times \frac{d i}{d t}$
or, $\frac{\mu_{0} a i_{0} \omega \cos \omega t}{2 \pi} \ell n[1+a / b]=M \times i_{0} \omega \cos \omega t$
$\Rightarrow \mathrm{M}=\frac{\mu_{0} \mathrm{a}}{2 \pi} \ln [1+\mathrm{a} / \mathrm{b}]$
96. emf induced $=\frac{\pi \mu_{0} N a^{2} a^{\prime 2} E R V}{2 L\left(a^{2}+x^{2}\right)^{3 / 2}(R / L x+r)^{2}}$

$\mu=\frac{E}{d i / d t}=\frac{N \mu_{0} \pi a^{2} a^{\prime 2}}{2\left(a^{2}+x^{2}\right)^{3 / 2}}$.
97. Solenoid I:

$\mathrm{a}_{2}=8 \mathrm{~cm}^{2} ; \mathrm{n}_{2}=2000 / 0.1 \mathrm{~m} ; \ell_{2}=10 \mathrm{~cm}=0.10 \mathrm{~m}$

$B=\mu_{0} n_{2} i \quad$ let the current through outer solenoid be $i$.
$\phi=n_{1}$ B.A $=n_{1} n_{2} \mu_{0} \mathrm{i} \times \mathrm{a}_{1}$
$=2000 \times \frac{2000}{0.1} \times 4 \pi \times 10^{-7} \times i \times 4 \times 10^{-4}$
$E=\frac{d \phi}{d t}=64 \pi \times 10^{-4} \times \frac{d i}{d t}$
Now $M=\frac{E}{\mathrm{di} / \mathrm{dt}}=64 \pi \times 10^{-4} \mathrm{H}=2 \times 10^{-2} \mathrm{H} . \quad[\mathrm{As} \mathrm{E}=\mathrm{Mdi} / \mathrm{dt}]$
