## SOLUTIONS TO CONCEPTS

## CHAPTER 13

1. $p=h \rho g$

It is necessary to specify that the tap is closed. Otherwise pressure will gradually decrease, as h decrease, because, of the tap is open, the pressure at the tap is atmospheric.
2. a) Pressure at the bottom of the tube should be same when considered for both limbs. From the figure are shown,

$$
\begin{aligned}
& p_{\mathrm{g}}+\rho_{\mathrm{Hg}} \times \mathrm{h}_{2} \times \mathrm{g}=\mathrm{p}_{\mathrm{a}}+\rho_{\mathrm{Hg}} \times \mathrm{h}_{1} \times \mathrm{g} \\
\Rightarrow \quad & \mathrm{p}_{\mathrm{g}}=\mathrm{p}_{\mathrm{a}}+\rho_{\mathrm{Hg}} \times \mathrm{g}\left(\mathrm{~h}_{1}-\mathrm{h}_{2}\right)
\end{aligned}
$$

b) Pressure of mercury at the bottom of $u$ tube

$$
\mathrm{p}=\mathrm{p}_{\mathrm{a}}+\rho_{\mathrm{Hg}} \mathrm{~h}_{1} \times \mathrm{g}
$$

3. From the figure shown
$\mathrm{p}_{\mathrm{a}}+\mathrm{h} \rho \mathrm{g}=\mathrm{p}_{\mathrm{a}}+\mathrm{mg} / \mathrm{A}$
$\Rightarrow h \rho g=\mathrm{mg} / \mathrm{A}$
$\Rightarrow \mathrm{h}=\frac{\mathrm{m}}{\mathrm{Ap}}$

4. a) Force exerted at the bottom.
$=$ Force due to cylindrical water colum + atm. Force
$=A \times h \times \rho_{w} \times g+p_{a} \times A$
$=A\left(h \rho_{w} g+p_{a}\right)$
b) To find out the resultant force exerted by the sides of the glass, from the freebody, diagram of water inside the glass
$p_{a} \times A+m g=A \times h \times \rho_{w} \times g+F_{s}+p_{a} \times A$
$\Rightarrow \mathrm{mg}=\mathrm{A} \times \mathrm{h} \times \rho_{\mathrm{w}} \times \mathrm{g}+\mathrm{F}_{\mathrm{s}}$
This force is provided by the sides of the glass.
5. If the glass will be covered by a jar and the air is pumped out, the atmospheric pressure has no effect.

So,
a) Force exerted on the bottom.
$=\left(h \rho_{w} g\right) \times A$
b) $\mathrm{mg}=\mathrm{h} \times \rho_{\mathrm{w}} \times \mathrm{g} \times \mathrm{A} \times \mathrm{F}_{\mathrm{s}}$.
c) It glass of different shape is used provided the volume, height and area remain same, no change in answer will occur.
6. Standard atmospheric pressure is always pressure exerted by 76 cm Hg column $=(76 \times 13.6 \times \mathrm{g})$ Dyne $/ \mathrm{cm}^{2}$.
If water is used in the barometer.
Let $\mathrm{h} \rightarrow$ height of water column.
$\therefore \mathrm{h} \times \rho_{\mathrm{w}} \times \mathrm{g}$
7. a) $F=P \times A=\left(h \rho_{w} \times g\right) A$
b) The force does not depend on the orientation of the rock as long as the surface area remains same.
8. a) $F=A h \rho g$.
b) The force exerted by water on the strip of width $\delta x$ as shown,
$d F=p \times A$
$=(x \rho g) \times A$
c) Inside the liquid force act in every direction due to adhesion.

$$
\mathrm{di}=\mathrm{F} \times \mathrm{r}
$$

d) The total force by the water on that side is given by

$$
F=\int_{0}^{1} 20000 x \delta x \Rightarrow F=20,000\left[x^{2} / 2\right]_{0}^{1}
$$

e) The torque by the water on that side will be,

$$
\begin{equation*}
\mathrm{i}=\int_{0}^{1} 20000 \mathrm{x} \delta \mathrm{x}(1-\mathrm{x}) \Rightarrow 20,000\left[\mathrm{x}^{2} / 2-\mathrm{x}^{3} / 3\right]_{0}^{1} \tag{1}
\end{equation*}
$$

9. Here, $\mathrm{m}_{0}=\mathrm{m}_{\mathrm{Au}}+\mathrm{m}_{\mathrm{cu}}=36 \mathrm{~g}$

Let $V$ be the volume of the ornament in $\mathrm{cm}^{3}$
So, $V \times \rho_{w} \times g=2 \times g$
$\Rightarrow\left(\mathrm{V}_{\mathrm{au}}+\mathrm{V}_{\mathrm{cu}}\right) \times \rho_{\mathrm{w}} \times \mathrm{g}=2 \times \mathrm{g}$
$\Rightarrow\left(\frac{\mathrm{m}}{\rho_{\mathrm{au}}}+\frac{\mathrm{m}}{\rho_{\mathrm{au}}}\right) \rho_{\mathrm{w}} \times \mathrm{g}=2 \times \mathrm{g}$
$\Rightarrow\left(\frac{\mathrm{m}_{\mathrm{Au}}}{19.3}+\frac{\mathrm{m}_{\mathrm{Au}}}{8.9}\right) \times 1=2$
$\Rightarrow 8.9 \mathrm{~m}_{\mathrm{Au}}+19.3 \mathrm{~m}_{\mathrm{cu}}=2 \times 19.3 \times 8.9=343.54$
From equation (1) and (2), $8.9 \mathrm{~m}_{\mathrm{Au}}+19.3 \mathrm{~m}_{\mathrm{cu}}=343.54$
$\Rightarrow \frac{8.9\left(\mathrm{~m}_{\mathrm{Au}}+\mathrm{m}_{\mathrm{cu}}\right)=8.9 \times 36}{\mathrm{~m}_{\mathrm{cu}}=2.225 \mathrm{~g}}$
So, the amount of copper in the ornament is 2.2 g .
10. $\left(\frac{M_{A u}}{\rho_{A u}}+V_{c}\right) \rho_{w} \times g=2 \times g$ (where $V_{c}=$ volume of cavity)
11. $m g=U+R$ (where $U=$ Upward thrust)
$\Rightarrow m g-U=R$
$\Rightarrow R=m g-v \rho_{w} g$ (because, $U=v \rho_{w} g$ )
$=m g-\frac{m}{\rho} \times \rho_{w} \times g$
12. a) Let $V_{i} \rightarrow$ volume of boat inside water $=$ volume of water displace in $\mathrm{m}^{3}$.

Since, weight of the boat is balanced by the buoyant force.
$\Rightarrow \mathrm{mg}=\mathrm{V}_{\mathrm{i}} \times \rho_{\mathrm{w}} \times \mathrm{g}$
b) Let, $\mathrm{v}^{1} \rightarrow$ volume of boat filled with water before water starts coming in from the sides. $m g+v^{1} \rho_{w} \times g=V \times \rho_{w} \times g$.
13. Let $x \rightarrow$ minimum edge of the ice block in cm .

So, $\mathrm{mg}+\mathrm{W}_{\text {ice }}=\mathrm{U}$. (where $\mathrm{U}=$ Upward thrust)
$\Rightarrow 0.5 \times \mathrm{g}+\mathrm{x}^{3} \times \rho_{\text {ice }} \times \mathrm{g}=\mathrm{x}^{3} \times \rho_{\mathrm{w}} \times \mathrm{g}$
14. $\mathrm{V}_{\text {ice }}=\mathrm{V}_{\mathrm{k}}+\mathrm{V}_{\mathrm{w}}$
$V_{\text {ice }} \times \rho_{\text {ice }} \times g=V_{k} \times \rho_{k} \times g+V_{w} \times \rho_{w} \times g$
$\Rightarrow\left(\mathrm{V}_{\mathrm{k}}+\mathrm{V}_{\mathrm{w}}\right) \times \rho_{\text {ice }}=\mathrm{V}_{\mathrm{k}} \times \rho_{\mathrm{k}}+\mathrm{V}_{\mathrm{w}} \times \rho_{\mathrm{w}}$
$\Rightarrow \frac{\mathrm{V}_{\mathrm{w}}}{\mathrm{V}_{\mathrm{k}}}=1$.
15. $V_{i i g}=V \rho_{w} g$
16. $\left(m_{w}+m_{p b}\right) g=\left(V_{w}+V_{p b}\right) \rho \times g$
$\Rightarrow\left(m_{w}+m_{\mathrm{pb}}\right)=\left(\frac{\mathrm{m}_{\mathrm{w}}}{\rho_{\mathrm{w}}}+\frac{\mathrm{m}_{\mathrm{pb}}}{\rho_{\mathrm{pb}}}\right) \rho$
17. $M g=w \Rightarrow\left(m_{w}+m_{p b}\right) g=V_{w} \times \rho \times g$
18. Given, $x=12 \mathrm{~cm}$

Length of the edge of the block $\rho_{\mathrm{Hg}}=13.6 \mathrm{gm} / \mathrm{cc}$
Given that, initially $1 / 5$ of block is inside mercuty.
Let $\rho_{\mathrm{b}} \rightarrow$ density of block in gm/cc.
$\therefore(x)^{3} \times \rho_{\mathrm{b}} \times \mathrm{g}=(\mathrm{x})^{2} \times(\mathrm{x} / 5) \times \rho_{\mathrm{Hg}} \times \mathrm{g}$
$\Rightarrow 12^{3} \times \rho_{\mathrm{b}}=12^{2} \times 12 / 5 \times 13.6$
$\Rightarrow \rho_{\mathrm{b}}=\frac{13.6}{5} \mathrm{gm} / \mathrm{cc}$

After water poured, let $x=$ height of water column.
$\mathrm{V}_{\mathrm{b}}=\mathrm{V}_{\mathrm{Hg}}+\mathrm{V}_{\mathrm{w}}=12^{3}$
Where $\mathrm{V}_{\mathrm{Hg}}$ and $\mathrm{V}_{\mathrm{w}}$ are volume of block inside mercury and water respectively
$\therefore\left(\mathrm{V}_{\mathrm{b}} \times \rho_{\mathrm{b}} \times \mathrm{g}\right)=\left(\mathrm{V}_{\mathrm{Hg}} \times \rho_{\mathrm{Hg}} \times \mathrm{g}\right)+\left(\mathrm{V}_{\mathrm{w}} \times \rho_{\mathrm{w}} \times \mathrm{g}\right)$
$\Rightarrow\left(\mathrm{V}_{\mathrm{Hg}}+\mathrm{V}_{\mathrm{w}}\right) \rho_{\mathrm{b}}=\mathrm{V}_{\mathrm{Hg}} \times \rho_{\mathrm{Hg}}+\mathrm{V}_{\mathrm{w}} \times \rho_{\mathrm{w}}$.
$\Rightarrow\left(\mathrm{V}_{\mathrm{Hg}}+\mathrm{V}_{\mathrm{w}}\right) \times \frac{13.6}{5}=\mathrm{V}_{\mathrm{Hg}} \times 13.6+\mathrm{V}_{\mathrm{w}} \times 1$
$\Rightarrow(12)^{3} \times \frac{13.6}{5}=(12-x) \times(12)^{2} \times 13.6+(x) \times(12)^{2} \times 1$
$\Rightarrow x=10.4 \mathrm{~cm}$
19. Here, $\mathrm{Mg}=$ Upward thrust
$\Rightarrow \mathrm{V} \rho \mathrm{g}=(\mathrm{V} / 2)\left(\rho_{\mathrm{w}}\right) \times \mathrm{g}$ (where $\rho_{\mathrm{w}}=$ density of water)
$\Rightarrow\left(\frac{4}{3} \pi r_{2}{ }^{3}-\frac{4}{3} \pi r_{1}{ }^{3}\right) \rho=\left(\frac{1}{2}\right)\left(\frac{4}{3} \pi r_{2}{ }^{3}\right) \times \rho_{w}$
$\Rightarrow\left(r_{2}^{3}-r_{1}^{3}\right) \times \rho=\frac{1}{2} r_{2}^{3} \times 1=865 \mathrm{~kg} / \mathrm{m}^{3}$.
20. $W_{1}+W_{2}=U$.
$\Rightarrow \mathrm{mg}+\mathrm{V} \times \rho_{\mathrm{s}} \times \mathrm{g}=\mathrm{V} \times \rho_{\mathrm{w}} \times \mathrm{g}$ (where $\rho_{\mathrm{s}}=$ density of sphere in $\mathrm{gm} / \mathrm{cc}$ )
$\Rightarrow 1-\rho_{\mathrm{s}}=0.19$
$\Rightarrow \rho_{\mathrm{s}}=1-(0.19)=0.8 \mathrm{gm} / \mathrm{cc}$
So, specific gravity of the material is 0.8 .
21. $W_{i}=m g-V_{i} \rho_{\text {air }} \times g=\left(m-\frac{m}{\rho_{i}} \rho_{\text {air }}\right) g$
$W_{w}=m g-V_{w} \rho_{\text {air }} g=\left(m-\frac{m}{\rho_{w}} \rho_{\text {air }}\right) g$
22. Driving force $U=V \rho_{w} g$
$\Rightarrow a=\pi r^{2}(X) \times \rho_{w} g \Rightarrow T=2 \pi \sqrt{\frac{\text { displacement }}{\text { Acceleration }}}$
23. a) $F+U=m g$ (where $F=k x)$
$\Rightarrow \mathrm{kx}+\mathrm{V} \rho_{\mathrm{w}} \mathrm{g}=\mathrm{mg}$
b) $F=k X+V \rho_{w} \times g$
$\Rightarrow \mathrm{ma}=\mathrm{kX}+\pi \mathrm{r}^{2} \times(\mathrm{X}) \times \rho_{\mathrm{w}} \times \mathrm{g}=\left(\mathrm{k}+\pi \mathrm{r}^{2} \times \rho_{\mathrm{w}} \times \mathrm{g}\right) \mathrm{X}$
$\Rightarrow \omega^{2} \times(X)=\frac{\left(k+\pi r^{2} \times \rho_{w} \times g\right)}{m} \times(X)$
$\Rightarrow \mathrm{T}=2 \pi \sqrt{\frac{\mathrm{~m}}{\mathrm{~K}+\pi \mathrm{r}^{2} \times \rho_{\mathrm{w}} \times \mathrm{g}}}$
24. a) $m g=k X+V \rho_{w} g$
b) $a=k x / m$

$$
\mathrm{w}^{2} \mathrm{x}=\mathrm{kx} / \mathrm{m}
$$

$$
\mathrm{T}=2 \pi \sqrt{\mathrm{~m} / \mathrm{k}}
$$

25. Let $x \rightarrow$ edge of ice block

When it just leaves contact with the bottom of the glass.
$\mathrm{h} \rightarrow$ height of water melted from ice

$$
\mathrm{W}=\mathrm{U}
$$

$\Rightarrow \mathrm{x}^{3} \times \rho_{\mathrm{ice}} \times \mathrm{g}=\mathrm{x}^{2} \times \mathrm{h} \times \rho_{\mathrm{w}} \times \mathrm{g}$
Again, volume of water formed, from melting of ice is given by,
$4^{3}-x^{3}=\pi \times r^{2} \times h-x^{2} h\left(\right.$ because amount of water $\left.=\left(\pi r^{2}-x^{2}\right) h\right)$
$\Rightarrow 4^{3}-x^{3}=\pi \times 3^{2} \times h-x^{2} h$
Putting $h=0.9 x \Rightarrow x=2.26 \mathrm{~cm}$.
26. If $p_{a} \rightarrow$ atm. Pressure
$\mathrm{A} \rightarrow$ area of cross section
$h \rightarrow$ increase in hright
$p_{a} A+A \times L \times \rho \times a_{0}=p a^{A}+h \rho g \times A$
$\Rightarrow h g=a_{0} L \quad \Rightarrow \quad a_{0} L / g$
27. Volume of water, discharged from Alkananda + vol are of water discharged from Bhagirathi $=$ Volume of water flow in Ganga.
28. a) $a_{A} \times V_{A}=Q_{A}$
b) $a_{A} \times V_{A}=a_{B} \times V_{B}$
c) $1 / 2 \rho v_{A}^{2}+p_{A}=1 / 2 \rho v_{B}^{2}+p_{B}$

$$
\Rightarrow\left(\mathrm{p}_{\mathrm{A}}-\mathrm{p}_{\mathrm{B}}\right)=1 / 2 \rho\left(\mathrm{v}_{\mathrm{B}}^{2}-\mathrm{v}_{\mathrm{A}}^{2}\right)
$$

29. From Bernoulli's equation, $1 / 2 \rho v_{A}^{2}+\rho g h_{A}+p_{A}$
$=1 / 2 \rho v_{B}^{2}+\rho g h_{B}+p_{B}$.
$\Rightarrow P_{A}-P_{B}=(1 / 2) \rho\left(v_{B}^{2}-v_{A}^{2}\right)+\rho g\left(h_{B}-h_{A}\right)$
30. $1 / 2 \rho v_{B}^{2}+\rho g h_{B}+p_{B}=1 / 2 \rho v_{A}{ }^{2}+\rho g h_{A}+p_{A}$
31. $1 / 2 \rho v_{A}^{2}+\rho g h_{A}+p_{A}=1 / 2 \rho v_{B}^{2}+\rho g h_{B}+p_{B}$
$\Rightarrow P_{B}-P_{A}=1 / 2 \rho\left(v_{A}^{2}-v_{B}^{2}\right)+\rho g\left(h_{A}-h_{B}\right)$
32. $\vec{v}_{A} a_{A}=\vec{v}_{B} \times a_{B}$
$\Rightarrow 1 / 2 \rho v_{A}^{2}+\rho g h_{A}+p_{A}=1 / 2 \rho v_{B}^{2}+\rho g h_{B}+p_{B}$
$\Rightarrow 1 / 2 \rho v_{A}^{2}+p_{A}=1 / 2 \rho v_{B}^{2}+p_{B}$
$\Rightarrow P_{A}-P_{B}=1 / 2 \rho\left(v_{B}{ }^{2}-v_{B}{ }^{2}\right)$
Rate of flow $=v_{a} \times a_{A}$
33. $\mathrm{V}_{\mathrm{A}} \mathrm{a}_{\mathrm{A}}=\mathrm{v}_{\mathrm{B}} \mathrm{a}_{\mathrm{B}} \Rightarrow \frac{\mathrm{v}_{\mathrm{A}}}{\mathrm{B}}=\frac{\mathrm{a}_{\mathrm{B}}}{\mathrm{a}_{\mathrm{A}}}$
$5 \mathrm{v}_{\mathrm{A}}=2 \mathrm{v}_{\mathrm{B}} \Rightarrow \mathrm{v}_{\mathrm{B}}=(5 / 2) \mathrm{v}_{\mathrm{A}}$
$1 / 2 \rho v_{A}^{2}+\rho g h_{A}+p_{A}=1 / 2 \rho v_{B}^{2}+\rho g h_{B}+p_{B}$
$\Rightarrow P_{A}-P_{B}=1 / 2 \rho\left(v_{B}^{2}-v_{B}^{2}\right)\left(\right.$ because $\left.P_{A}-P_{B}=h \rho_{m} g\right)$
34. $P_{A}+(1 / 2) \rho v_{A}^{2}=P_{B}+(1 / 2) \rho v_{B}^{2} \Rightarrow p_{A}-p_{B}=(1 / 2) \rho v_{B}^{2}\left\{v_{A}=0\right\}$
$\Rightarrow \rho g h=(1 / 2) \rho v_{B}^{2}\left\{p_{A}=p_{a t m}+\rho g h\right\}$
$\Rightarrow \mathrm{v}_{\mathrm{B}}=\sqrt{2 \mathrm{gh}}$
a) $v=\sqrt{2 g h}$
b) $v=\sqrt{2 g(h / 2)}=\sqrt{g h}$
c) $v=\sqrt{2 g h}$
$v=a v \times d t$
$\mathrm{AV}=a v$
$\Rightarrow A \times \frac{d h}{d t}=\mathrm{a} \times \sqrt{2 \mathrm{gh}} \Rightarrow \mathrm{dh}=\frac{\mathrm{a} \times \sqrt{2 \mathrm{gh}} \times \mathrm{dt}}{\mathrm{A}}$
d) $d h=\frac{a \times \sqrt{2 g h} \times d t}{A} \Rightarrow T=\frac{A}{a} \sqrt{\frac{2}{g}}\left[\sqrt{H_{1}}-\sqrt{H_{2}}\right]$
35. $v=\sqrt{2 g(H-h)}$
$\mathrm{t}=\sqrt{2 \mathrm{~h} / \mathrm{g}}$
$x=v \times t=\sqrt{2 g(H-h) \times 2 h / g}=4 \sqrt{\left(H h-h^{2}\right)}$
So, $\Rightarrow\left(\frac{d}{d h}\right)\left(H h-h^{2}\right)=0 \Rightarrow 0=H-2 h \Rightarrow h=H / 2$.
